

Deep Thought Culture Tech — Task 2 Submission

Role: Clinic Operations Analyst — Patient Care & Communication System

Objective

Design a system to reduce the doctor's non-clinical workload while ensuring patients receive timely, accurate communication. The system should be practical, run daily by staff, and involve the doctor only when necessary.

STEP 1 — Message Type Classification (One-Time Setup)

Purpose: Determine which messages require doctor approval and which can be automated.

Message Type	Example	Doctor Input Needed?
Follow-up Reminder	"Please visit on Aug 5"	No
Post-Procedure Care	"Mild swelling is normal"	No
Side-Effect Advisory	"Nausea may occur"	No
Custom Instruction	"Avoid sun exposure 7 days"	Yes
Patient Question Response	"Regarding itching..."	Yes

STEP 2 — Care Control Sheet (Daily Working Sheet)

Purpose: Track all patient messages and their status.

Example Table (Google Sheet):

Patient	Phone	Visit Type	Message Type	Message Text	Doctor Approval	Status
Ramesh K	9XXXXXXX	OPD	Follow-up	Auto-filled	Not Required	Pending
Sita P	9XXXXXXX	Procedure	Post-Procedure	Auto-filled	Not Required	Pending
Arjun M	9XXXXXXX	OPD	Custom	Blank	Required	Waiting

Process:

- Staff updates the sheet daily.
- Only messages needing doctor approval go to doctor.
- Routine messages are automated in the sheet.

STEP 3 — Doctor Review Window (Every 3–4 Hours)

- Filter sheet: Doctor Approval = Required & Status = Waiting
- Sit with doctor for ~10 minutes
- Doctor approves or dictates message
- Staff types and sends once
- Doctor never types messages manually

STEP 4 — Patient Question Handling (Google Form Flow)

Setup:

- Patients submit questions via Google Form
- Responses auto-populate another sheet

Example Table:

Patient	Phone	Question	Answer	Status
Lakshmi	9XXXXXXX	Is itching normal?	—	Pending

Process:

- Batch questions every 3 hours
- Staff reviews, fills answers
- Doctor approves only if required
- Update **Status** → **Sent** → **Closed**

STEP 5 — Message Dispatch Logic

- Send messages only if:
 - Message Text is filled
 - Status = Pending
 - Doctor Approval = Not Required OR Approved
- Status transitions: Pending → Sent → Closed

STEP 6 — Daily Closing Check (5 mins/day)

- Filter Status = Pending
- Ensure nothing critical is missed
- Reschedule if needed

STEP 7 — Optional Automation

- Describe potential Google Apps Script or messaging API automation:
 - Read pending rows
 - Send WhatsApp messages automatically
 - Update status to “Sent”

Daily Checklist (10–15 mins/day)

1. Fill Care Control Sheet with new patients and messages
2. Filter sheet for Doctor Approval = Required & Pending
3. Sit with doctor for approvals (~10 mins)
4. Send approved messages
5. Perform daily closing check for pending items

Summary:

This system:

- Protects doctor time
- Reduces WhatsApp and manual messaging chaos
- Is practical and runnable by clinic staff daily
- Uses automation only for routine messages, with human judgment where needed
